A New PIANC Standard of Practice for Managing Environmental Risks of Navigation Infrastructure Projects

Chair: Burton Suedel
Co-Chair: Kevin Kane
Mentor: Todd Bridges

34th PIANC World Congress
Panama City, Panama
May 2018
PIANC WG 175: A Practical Guide to Environmental Risk Management (ERM) for Navigation Infrastructure Projects

Members:

- Burton Suedel (US): Research Biologist
- Kevin Kane (AU): Senior Manager, Environment
- David Moore (US): Research Biologist
- Rebecca Gardner (NO; Representing CEDA): Principle Engineer
- John Lally (US): Coastal Engineer
- Captain Kevin Allen (IE): Belfast Harbor Master
- Miran Vanwonterghem (BE): Project Engineer
- Amy Parry (UK) (YP): Marine Scientist
Objectives

• Provide technical information to decision makers regarding the risk management process for waterborne infrastructure

• Provide a methodology to inform risk management decisions for the comprehensive range of environmental risks pertinent to waterborne infrastructure

• Provide a practical approach for managing effects of project components in the context of natural change in time and space, and the ability of environmental resources to recover from or compensate for damage

• Provide recent case studies

• Incorporate PIANC’s Working with Nature philosophy
Environmental Risk Management

“The process of identifying, evaluating, selecting, and implementing actions to reduce risk to human health and to ecosystems. The goal of risk management is scientifically sound, cost-effective, integrated actions that reduce or prevent risks while taking into account social, cultural, ethical, political, and legal considerations.”

Presidential/Congressional Commission on Risk Assessment and Risk Management (Omenn et al. 1997)
- Formulate project
- Perform risk assessments
- Characterize risks & identify risk management strategies
- Evaluate alternatives & select project
- Develop environmental management plan
- Initiate project and implement management strategies
- Reporting and feedback
Conceptual Models

“Setting the course”

www.pianc.org
Working With Nature

• Promotes an integrated planning and design process
• Seeks to utilize the hydrodynamics of the ecosystem to produce desired effects
• Focuses on environmental aspects of the system to support project goals

The river island at Horseshoe Bend on the lower Atchafalaya River, Louisiana has self-designed by dredged sediment strategically placed upriver, allowing the river’s energy to disperse the sediment, contributing to the island’s growth, creating environmental and other benefits.
Stakeholders

When managing environmental risks adaptively, engaging stakeholders early in the risk management process is crucial to achieving a common understanding of project uncertainties and opportunities, so that adjustments to project operating processes can be developed.

PIANC Navigating a Changing Climate: Action Plan of the PIANC Think Climate Coalition, November 2015; http://navclimate.pianc.org/about/action-plan
Adaptive Management

• AM enables a project with uncertainties relating to environmental impacts to proceed with a pre-negotiated monitoring and management plan to evaluate and mitigate actual effects on receptors, rather than design of a project with strict environmental thresholds.
Evaluation of Project Alternatives

- Multicriteria decision analysis
- Socio-economic cost benefit analysis
- Cost Efficiency Analysis
- Structured decision making
- Bayesian Networks
Case Studies

Description of case studies communicating risk management principles and best practices addressing, for example resuspended sediments, the Working with Nature concept, climate change, and beneficial use of dredged material

Case Study Example: River Training Structures

Blunt Nosed Chevrons at Miss. River Mile 266
USACE St. Louis District, Applied River Engineering Center
Problem

- Navigation channel alignment and sedimentation can be problematic to maintaining inland waterways
- River training structures (i.e., dikes) used to modify the hydraulic flow and sediment response to improve and/or restore the river for human and environmental benefit
- Dikes installed perpendicular to the bank line to help alleviate such issues
- Dikes created self maintaining navigation channels, but sedimentation occurred behind them, decreasing habitat diversity
Stakeholder Engagement

• Multi-stakeholder team assembled to develop a robust site conceptual model to inform design, selection and construction of viable alternatives

• Representatives from navigation industry, local landowners, scientists and engineers from relevant regulatory and resource agencies

• Supported developing data collection program (e.g., high resolution multi-beam bathymetric surveys, acoustic doppler current profiles, fish collection, etc.) to inform conceptual site model, establish performance criteria and parameterize physical models for evaluation of proposed design alternatives.
A WwN Solution

Blunt Nosed Chevrons

- Reduce a continuous need to dredge
- Alleviate dangerous navigation conditions through several bridge crossings
- Support local facilities with shoaling problems
- Increase habitat diversity and support species restoration

“Setting the course”
**Constructed Chevron Examples**

Aerial view (looking upstream) of three chevrons at St. Louis Harbor. Note sand bar island, a habitat used by many wildlife species, created downstream from the middle and nearest chevron structures.

Aerial view of chevrons at Gilbert. Note sand bar islands created downstream from the chevron structures.

Aerial view of chevrons at Bolters Bar. Note sand bar islands created downstream from the chevron structures.

(All photos courtesy of USACE St. Louis District).
Blunt Nosed Chevrons at St. Louis Harbor

- Hydrographic Survey images from May 2007 before chevron construction and March 2009 after chevron construction
- By splitting the flow, deposition problems were greatly reduced in main channel and along bankline
- Due to the enhanced diversity of the river bed and increased habitat types created, number of species retrieved post-construction more than doubled pre-construction
Miss. River Lock & Dam 25 Approach

- Five LD 25 Approach Structures
  - Four Chevrons on LDB
  - One Chevron on RDB
- Constructed in FY13 for $3.2M
- Reduced repetitive dredging location
- Provided better alignment to the entrance of the lock chamber
Training Structures Benefits Summary

- **Navigation**: Improved channel
  - Decrease side channel conveyance
  - Increase main channel conveyance

- **Economic**: Reduced dredging requirements – lowered dredging costs

- **Environmental**: Created diverse riverine habitat
  - Invertebrates and fish

- **Reduced navigation risk**
  - Increased navigation safety
Take Away Points

- Effective waterways management practices are being implemented as part of maintenance dredging and navigation projects, consistent with WwN principles.
- Communication essential to promote these good practices.
- Lessons learned so innovative approaches can be more broadly applied.
- Utilize nature’s energy to achieve multiple benefits.
